Summary

Introduction: Useful definitions and context for gastroenterologists

Jaroslaw Regula

Postgraduate Teaching Programme Barcelona 2026 | Presentation

Mechanisms & Personalised Medicine | Surgery | Digestive Oncology | Colorectal

October 18, 2026

This session addresses advanced colorectal cancer management, focusing on the evolving role of locoregional therapies, the need for complete molecular workup before treatment, and current systemic management algorithms.

KEY POINTS

- Overall survival and treatment results for advanced colorectal cancer have increased over recent years, with patients living much longer than previously
- Current ESMO guidelines from approximately six months ago now begin treatment algorithms by dividing patients into those amenable to locoregional therapies and those who are not, representing a change in approach
- Advanced colorectal cancer includes metastatic disease and locally advanced disease where surgical resection with curative intent is unlikely
- Locally advanced cancer is defined as a subgroup where only contiguous organs are involved and surgical locoregional therapies remain possible
- The session will debate the role of locoregional treatment in patients with metastatic disease and discuss whether complete molecular workup is necessary before initiating therapy
